# **Neural Networks**

# 1. Model

input:

 $x \in \mathbb{R}^n$ 

layer 1:

 $a^1 = x$ 

layer l:

 $a^{l} = \sigma(w^{l}a^{l-1} + b^{l}) \quad (l = 2, ..., L)$ 

layer L:

 $\hat{y} = a^L$ 

output:

 $\hat{y} \in \mathbb{R}^m$ 

#### 2. Backpropagation

definition:

$$z^{l} = w^{l}a^{l-1} + b^{l}, \ \delta^{l} = \frac{\partial C}{\partial z^{l}} \quad (l = 2, \dots, L)$$

output error  $\delta^L$ :

$$\delta^{L} = \frac{\partial C}{\partial z^{L}} = \frac{\partial C}{\partial \hat{y}} \cdot \frac{\partial \hat{y}}{\partial z^{L}}$$

$$= \frac{\partial C}{\partial a^{L}} \cdot \frac{\partial a^{L}}{\partial z^{L}} = \frac{\partial C}{\partial a^{L}} \odot \sigma'(z^{L}) \quad (\text{need } a^{L}, z^{L})$$

backpropagate the error:

$$\delta^{l} = ((w^{l+1})^{T} \delta^{l+1}) \odot \sigma'(z^{l}) \quad (\text{need } z^{l}; l = L - 1, L - 2, \dots, 2)$$

output:

$$\frac{\partial C}{\partial b^{l}} = \delta^{l} \quad (l = L, L - 1, \dots, 2)$$

$$\frac{\partial C}{\partial w^{l}} = \delta^{l} \cdot (a^{l-1})^{T} \quad (\text{need } a^{l-1}; l = L, L - 1, \dots, 2)$$

# 3. The Vanishing Gradient Problem

the simplest deep neural network:

the expression for  $\frac{\partial C}{\partial b^l}$ :

$$\frac{\partial C}{\partial b_1} = \sigma'(z_1) \times w_2 \times \sigma'(z_2) \times w_3 \times \sigma'(z_3) \times w_4 \times \sigma'(z_4) \times \frac{\partial C}{\partial a_4}$$

$$b_1 \longrightarrow b_2 \longrightarrow b_3 \longrightarrow b_4 \longrightarrow c$$

approaches to overcome the problem:

- Usage of GPU
- Usage of better activation functions
